

# Safe & Sound

Safe and Sound was developed to ease the minds of Elderly people and their loved ones by adding an additional layer of **security** along with their home alarm system. This system allows elderly users to be **alerted** if there is a disturbance near their Safe & Sound system via the raspberry pi. Relatives or loved ones can be **notified** via the app if something is wrong and may access a live feed through the raspberry pi camera. This system uses an Amazon Alexa enabled device to make it **easy and simple** for the elderly user to turn the system on.
